

ASS 2:

I want to do one object I can do maximum 3 connections

create 3 classes :

Singleton Class → it contains **getInstance** function to create new object (like singleton code)

Connection class → I declare the protocols(ssh,http,telnet,scp,ftp)

Function **release** to refuse the fourth/fifth connection or release to one from the three connections and change with the fourth

Function **getCurrentConnection** to return the list of all connections

Function **send** to return message type of connection because every connection is object in same class connection
